Global Configuration of Jails 1

Global Configuration of Jails

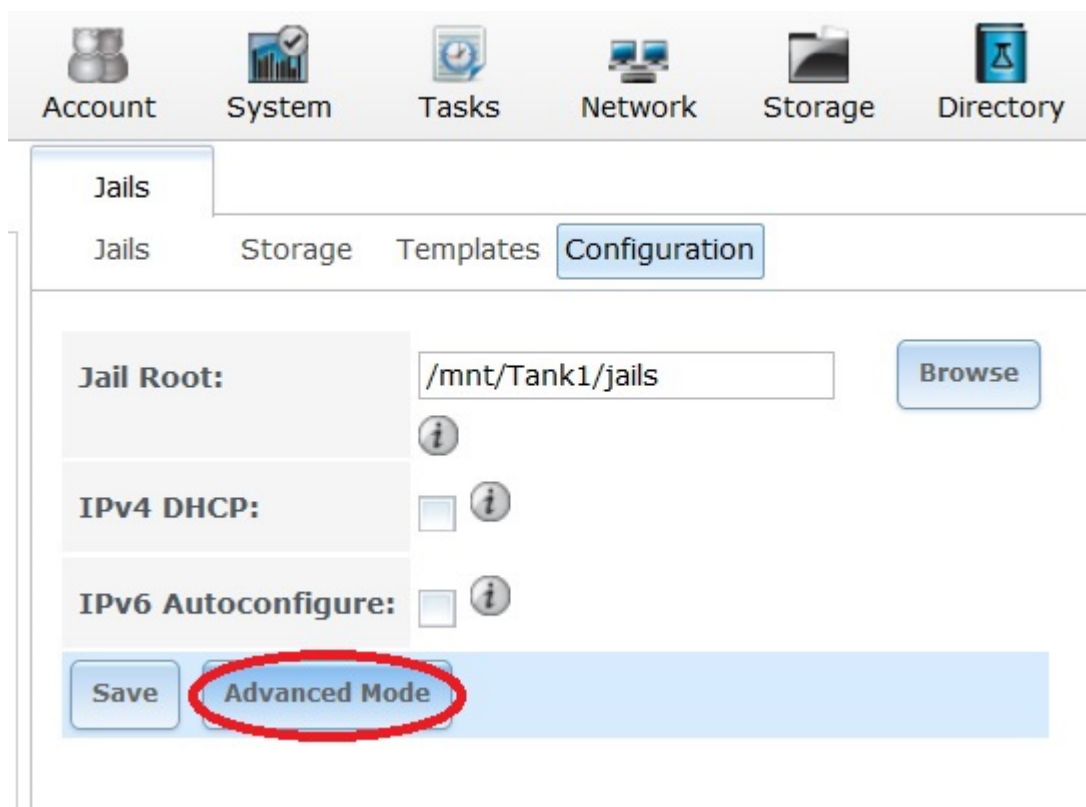

Before setting up any plugins on the server we must first configure the global settings for all Jails.

Go to the “Jails” page (1) and click on the “Configuration” button (2).

The screenshot shows the top navigation bar with icons for Account, System, Tasks, Network, Storage, Directory, Sharing, Services, Plugins, Jails, Reporting, and Wizard. The 'Jails' icon is circled in red with a red '1' below it. Below the navigation bar, there are tabs for 'Jails', 'Storage', 'Templates', and 'Configuration'. The 'Configuration' tab is selected and circled in red with a red '2' next to it. Below the tabs is an 'Add Jail' button. A table with columns 'Jail', 'IPv4 Address', 'Autostart', and 'Status' is shown, with the text 'No entry has been found' below it.

There is no need to change anything here, just click the “Advanced Mode” button.

The screenshot shows the top navigation bar with icons for Account, System, Tasks, Network, Storage, and Directory. Below the navigation bar, there are tabs for 'Jails', 'Storage', 'Templates', and 'Configuration'. The 'Configuration' tab is selected. Below the tabs, there are three configuration fields: 'Jail Root:' with a text box containing '/mnt/Tank1/jails' and a 'Browse' button; 'IPv4 DHCP:' with a checkbox and an information icon; and 'IPv6 Autoconfigure:' with a checkbox and an information icon. At the bottom, there are two buttons: 'Save' and 'Advanced Mode'. The 'Advanced Mode' button is circled in red.

In advanced mode we can now control the IP address range available to the jail/s. This is important because we want the IP address range to be separate and outside the IP address range of the DHCP server in the router. Jails did not work properly for me until I did this.

Type into the “IPv4 Network Start Address:” text box (1) the beginning of the IP address range for the

Jails (in Fester's case this is 192.168.0.9, this keeps the Jails away from the IP addresses assigned to the server's NICs which are 192.168.0.5 - 192.168.0.8).

Now type into the "IPv4 Network End Address:" text box (2) the end of the IP address range for the Jails (in Fester's case this is 192.168.0.49, the end IP address of the range we set aside in the router).

Now click the "Save" button (3).

Fester does not use IPv6 addresses so this does not need configuration.

The screenshot shows the 'Jails' configuration page with the following fields and values:

- Jail Root:** /mnt/Tank1/jails (with a 'Browse' button)
- IPv4 DHCP:** (with an information icon)
- IPv4 Network:** 192.168.0.0/24 (with an information icon)
- IPv4 Network Start Address:** 192.168.0.9 (highlighted with a red box and labeled '1')
- IPv4 Network End Address:** 192.168.0.49 (highlighted with a red box and labeled '2')
- IPv6 Autoconfigure:** (with an information icon)
- IPv6 Network:** (empty field with an information icon)
- IPv6 Network Start Address:** (empty field with an information icon)
- IPv6 Network End Address:** (empty field with an information icon)
- Collection URL:** http://download.freenas.org (with an information icon)

At the bottom, the 'Save' button is circled in red and labeled '3', and the 'Basic Mode' button is also visible.

That's global configuration of the Jails done.

Next we need to install some plugins into the Jails.

Incidentally you are not confined by the plugins on offer in FreeNAS. It is technically possible to configure programs that work in FreeBSD so they will work in FreeNAS Jails. This requires a lot of manual configuration and probably some things Fester is completely unaware of at present. You will also need a good knowledge of FreeBSD commands and UNIX permissions in order to work this way. It offers a great deal of flexibility but is not easy.

Plugins however, are designed so that you can do everything you need from within the FreeNAS GUI.

Fester uses the supplied plugins in FreeNAS as I don't know enough at present to install and compile programs by hand for Jails.
