Network Global Configuration 1

Network Global Configuration

Click “Network” in the left column, then “Global Configuration”.

The screenshot shows the 'Global Configuration' page in the FreeNAS web interface. The page has a dark theme. At the top left, it says 'Network / Global Configuration' and at the top right, 'FreeNAS® © 2018 - IXsystems, Inc'. The configuration fields are as follows:

Field	Value	Reset	Help
Hostname	freenas	<input type="checkbox"/>	<input type="checkbox"/>
Domain	local	<input type="checkbox"/>	<input type="checkbox"/>
Additional Domains		<input type="checkbox"/>	<input type="checkbox"/>
IPv4 Default Gateway	192.168.1.1	<input type="checkbox"/>	<input type="checkbox"/>
IPv6 Default Gateway		<input type="checkbox"/>	<input type="checkbox"/>
Nameserver 1	192.168.1.1	<input type="checkbox"/>	<input type="checkbox"/>
Nameserver 2		<input type="checkbox"/>	<input type="checkbox"/>
Nameserver 3		<input type="checkbox"/>	<input type="checkbox"/>
HTTP Proxy		<input type="checkbox"/>	<input type="checkbox"/>

- Give your server a name by typing into the “Hostname” text box.
- Your server will most likely be on your private network behind the router so the “Domain” should be “local”.
- Input the Default Gateway IP address of your private network into the “IPv4 Default Gateway:” text box (in Fester’s case this is 192.168.1.1).
- In the Nameserver 1:” text box put in the IP address of your ISPs Primary DNS server. You should be able to get this from your router or the ISPs website.
- In the Nameserver 2:” text box put in the IP address of your ISPs Secondary DNS server.
- In the Nameserver 3:” text box put in the IP address of your ISPs Tertiary DNS server. Not all ISPs have a third DNS server so leave it blank if this is the case.
- Now click the “Save” button.

If you do not know, and cannot find, the IP addresses for your ISP's DNS servers, you can use Cloudflare's Public DNS servers. Use 1.1.1.1 for the primary DNS server, and 1.0.0.1 for the secondary.

The server can now find the Primary and Secondary DNS servers. This means web addresses (URLs) can now be resolved to IP addresses.
